Experiment 1: CRUD Operations Using MongoDB

Aim: To create an Employee collection and perform CRUD operations using MongoDB.

a) Insert employee details

```
use employeeDB;

db.employees.insertMany([
 { empId:"E001", name:"Anjali", age:35, gender:"Female", department:"HR",
salary:48000, address:{city:"Bangalore",pincode:560001} },
 { empId:"E002", name:"Rakesh", age:42, gender:"Male", department:"IT",
salary:62000, address:{city:"Mysore",pincode:570012} },
 { empId:"E003", name:"Divya", age:29, gender:"Female",
department:"Marketing", salary:45000,
address:{city:"Chennai",pincode:600001} },
 { empId:"E004", name:"Manoj", age:38, gender:"Male", department:"IT",
salary:72000, address:{city:"Hyderabad",pincode:500001} }
]);
```

b) Retrieve employees aged 40 or below

```
db.employees.find({age:{$lte:40}}).pretty();
```

c) Display employees earning less than ₹50,000

```
db.employees.find({salary:{$lt:50000}}).pretty();
```

d) Update employee details

Update E003's salary to ₹55,000:

```
db.employees.updateOne({empId:"E003"},{$set:{salary:55000}});
```

Change the IT department to Tech Support:

```
db.employees.updateMany({department:"IT"},{$set:{department:"Tech
Support"}});
```

e) Delete employees belonging to the HR department

```
db.employees.deleteMany({department:"HR"});
db.employees.find().pretty();
```

Result: CRUD operations (Insert, Retrieve, Update, and Delete) were performed on the Employee collection successfully using MongoDB.
